INTRODUCING ALGAPRIME™ DHA:
A TRACEABLE, SUSTAINABLE, HIGH-QUALITY ALTERNATIVE TO MARINE-BASED OMEGA-3s

About one million tons of omega-3 rich fish oil is produced each year for use in aquaculture, animal feed and human nutrition. Global demand for omega-3s is growing. The availability of omega-3s from their current source – wild caught fish – is, however, limited.

AlgaPrime™ DHA is a scalable and sustainable long chain omega-3 rich whole algae ingredient for the aquaculture market.

ALGAPRIME™ DHA AT A GLANCE

From the original source of DHA: Whole algae ingredient from the native algae, Schizochytrium

High levels of DHA (~30%*): Provides flexibility to formulators

Sustainability: An alternative source of omega-3 to reduce dependency on marine fisheries and fish oil

Safety: Grown in controlled environments

Powder form: Easily incorporated in feed

Non-GMO: Our feedstock, algae strain and process is non-GMO

*Based on the % of DHA in dried biomass
CONSISTENT SUPPLY, CONSISTENT QUALITY

Our facility in the São Paulo state of Brazil grows the algae in closed fermentation tanks where they convert renewable, sustainable plant sugars into a DHA-rich ingredient in a matter of days. This process provides a traceable and consistent source of DHA and protects supply from the variability of geography and seasonality, improving supply chain resilience in the face of climate change and food insecurity.

GOOD FOR FISH AND GOOD FOR THE PLANET AT UNPRECEDENTED SCALE

AlgaPrime™ DHA is sustainably produced using sugar cane. The sugar cane waste provides a renewable source of energy for the sugar mill and the fermentation facility, powering some of the world's largest aerobic fermenters.

TYPICAL NUTRITIONAL PROFILE:
DHA CONTENT ON A DRY WEIGHT BASIS: 280mg/g
